<i>The Projected Annual Impact in 2028 of Texas Nonprofit Entities on Business Activity in Texas: Results by Industry</i>	325
Appendix D: Spending by Philanthropic Organizations	347

Introduction

Nonprofit establishments improve lives, communities, and society as a whole. These entities offer a variety of services and include hospitals and other health care providers, schools and universities, art museums, and many other types of operations. Not only do these organizations provide important services that enhance quality of life and societal wellbeing; they also generate substantial economic benefits through their operations and the associated multiple rounds of activity through the economy.

Nonprofit establishments improve lives, communities, and society as a whole. They also generate substantial economic benefits.

Using an extensive set of information related to nonprofit employment, payrolls, and other information maintained by public and private sources as a starting point, The Perryman Group measured the overall economic effects of nonprofit operations on the Texas economy and its various political subdivisions.

This study indicates that nonprofit entities generate almost **1.4 million** jobs across the state when multiplier effects are considered. These benefits ripple through the economy and generate business activity across a spectrum of industries. These contributions are expected to increase notably in the coming years.

This study indicates that nonprofit entities generate almost 1.4 million Texas jobs when multiplier effects are considered.

This report and the accompanying Appendices describe The Perryman Group's results as well as the methods and assumptions used in this assessment.

Current Economic Benefits of Texas Nonprofit Entities

Texas nonprofit entities directly employ more than 540,000 persons as of 2018. They also purchase needed supplies, pay for services, and otherwise provide an economic stimulus to communities across the state.

The Perryman Group has developed methods for measuring the multiple rounds of business activity that occur in response to any economic stimulus. (A brief overview of the methods used to measure economic impacts and a definition of terms is provided on page 3, with further detail in the Appendices to this report.)

The Perryman Group estimates that the total current economic benefits of ongoing operations of Texas nonprofit entities include **\$216.6 billion** in annual expenditures, **\$110.0 billion** in annual gross product, **\$74.7 billion** in annual personal income, and nearly **1.4 million** jobs.

*When multiplier effects are considered, the total increase in business activity in Texas associated with nonprofit entities across the state includes an estimated **\$110 billion** in gross product each year and almost **1.4 million** jobs.*

Measuring Economic Impacts

Any economic stimulus, whether positive or negative, generates multiplier effects throughout the economy. In this instance, ongoing operations of Texas nonprofits lead to increases in business activity which ripple through the economy.

The Perryman Group's input-output assessment system (the US Multi-Regional Impact Assessment System, which is described in further detail in the Appendices to this report) was developed by the firm more than 35 years ago and has been consistently maintained and updated since that time. The model has been used in hundreds of analyses for clients ranging from major corporations to government agencies and has been peer reviewed on multiple occasions. The impact system uses a variety of data (from surveys, industry information, and other sources) to describe the various goods and services (known as resources or inputs) required to produce another good/service. This process allows for estimation of the total economic impact (including multiplier effects) of nonprofit operations. The models used in the current analysis reflects the specific industrial composition and characteristics of the Texas economy and the regions analyzed.

Total economic effects are quantified for key measures of business activity:

- **Total expenditures** (or total spending) measure the dollars changing hands as a result of the economic stimulus.
- **Gross product** (or output) is production of goods and services that will come about in each area as a result of the activity. This measure is parallel to the gross domestic product numbers commonly reported by various media outlets and is a subset of total expenditures.
- **Personal income** is dollars that end up in the hands of people in the area; the vast majority of this aggregate derives from the earnings of employees, but payments such as interest and rents are also included.
- **Job gains** are expressed as permanent jobs because effects are ongoing.

Monetary values were quantified on a constant (2018) basis to eliminate the effects of inflation. See the Appendices for additional information regarding the methods and assumptions used in this analysis.

Benefits by Type of Nonprofit Entity

The Perryman Group measured the economic benefits of various types of entities. Nonprofit hospitals lead to gains in business activity across Texas of **\$43.5 billion** in gross product per year and **526,788** jobs when multiplier effects are included.

Summary of Current Benefits by Type of Nonprofit Entity

	Total Expenditures	Gross Product	Personal Income	Permanent Jobs
Research and Management*	\$13.9 b	\$7.4 b	\$5.1 b	80,698
Colleges, Universities, and Professional Schools	\$13.1 b	\$6.8 b	\$4.7 b	97,486
Elementary and Secondary Schools	\$19.3 b	\$9.2 b	\$6.3 b	125,381
Other Educational Services and Institutions	\$2.6 b	\$1.3 b	\$0.9 b	18,697
Ambulatory Health Care Services	\$19.4 b	\$10.8 b	\$7.5 b	134,314
Hospitals	\$85.9 b	\$43.5 b	\$29.9 b	526,788
Nursing and Residential Care Facilities	\$12.1 b	\$6.4 b	\$4.4 b	77,743
Social Assistance	\$20.8 b	\$10.5 b	\$7.2 b	146,896
Religious Organizations	\$9.5 b	\$5.0 b	\$3.5 b	71,592
Philanthropic Organizations	\$1.1 b	\$0.5 b	\$0.4 b	7,271
Arts, Entertainment, Cultural, and Recreation	\$9.0 b	\$4.2 b	\$2.6 b	52,393
Other*	\$9.8 b	\$4.6 b	\$2.2 b	38,353
TOTAL, ALL CATEGORIES	\$216.6 b	\$110.0 b	\$74.7 b	1,377,612

*Note: Includes multiplier effects. Components may not sum to total due to rounding. Based on 2018 levels of activity. See page 3 and the Appendices for additional information regarding measures of business activity and methods used. "Research and Management" includes Professional, Scientific, and Technical Services; Management of Companies and Enterprises; and Administrative and Support and Waste Management and Remediation Services. "Other" includes Construction, Retail Trade, Transportation and Warehousing, Information, Finance and Insurance, Real Estate and Rental and Leasing, and Accommodation and Food Services.

Current Benefits by Industry

As noted, economic benefits generated by nonprofit entities flow through the economy, affecting other businesses that supply needed input goods and services and generating payroll effects. All major industry groups are positively affected, with services industries and wholesale and retail trade experiencing particularly strong gains.

Summary of Current Benefits for Texas Industry Groups

	Total Expenditures	Gross Product	Personal Income	Permanent jobs
Commodities	\$6.6 b	\$1.7 b	\$1.1 b	13,001
Construction	\$5.1 b	\$2.7 b	\$2.3 b	30,899
Manufacturing	\$29.2 b	\$9.2 b	\$5.1 b	78,059
Transportation, Utilities, Information	\$21.5 b	\$9.7 b	\$5.1 b	52,772
Wholesale and Retail Trade	\$35.2 b	\$25.8 b	\$15.0 b	399,805
Financial Activities	\$34.0 b	\$9.5 b	\$3.3 b	33,096
Services	\$84.9 b	\$51.3 b	\$42.9 b	769,980
TOTAL, ALL INDUSTRIES	\$216.6 b	\$110.0 b	\$74.7 b	1,377,612

Note: Includes multiplier effects. Components may not sum to total due to rounding. Based on 2018 levels of activity. See page 3 and the Appendices for additional information regarding measures of business activity and methods used.

The distribution of jobs across the economy by major industry group which are supported by Texas nonprofit entities is illustrated in the following graph.

Distribution of Texas Jobs Supported by Nonprofit Entities

Additional detailed results are included in the Appendices.

Benefits by Area

The Perryman Group measured the benefits by geographic area, including Counties, Metropolitan Statistical Areas, Council of Governments Regions, and Planning Regions. Benefits generally follow population patterns, with the largest positive effects realized in the state's largest metropolitan areas. However, rural areas of the state also see substantial gains, as noted in the following table.

Current Economic Benefits of Nonprofit Entities by Texas Metropolitan Area

(based on 2018 levels of activity)

Metropolitan Area	Gross Product	Permanent Jobs
Abilene	\$1.0 b	13,563
Amarillo	\$1.2 b	14,937
Austin-Round Rock	\$8.1 b	104,129
Beaumont-Port Arthur	\$1.3 b	17,478
Brownsville-Harlingen	\$1.8 b	23,953
College Station-Bryan	\$0.9 b	11,842
Corpus Christi	\$2.0 b	25,671
Dallas-Plano-Irving	\$20.5 b	244,883
Fort Worth-Arlington	\$10.3 b	129,894
El Paso	\$3.0 b	37,075
Houston-The Woodlands-Sugar Land	\$28.2 b	339,689
Killeen-Temple	\$1.8 b	24,016
Laredo	\$0.8 b	10,619
Longview	\$1.0 b	13,110
Lubbock	\$1.5 b	19,650
McAllen-Edinburg-Mission	\$3.3 b	44,624
Midland	\$0.3 b	4,364
Odessa	\$0.3 b	3,894
San Angelo	\$0.6 b	7,414
San Antonio-New Braunfels	\$10.8 b	138,795
Sherman-Denison	\$0.6 b	8,203
Tyler	\$1.7 b	21,280
Victoria	\$0.4 b	5,534
Waco	\$1.4 b	18,831
Wichita Falls	\$0.6 b	7,456
Rural Texas	\$6.5 b	86,709

Current Economic Benefits of Nonprofit Entities by Council of Governments Region

(based on 2018 levels of activity)

Council of Governments Region	Gross Product	Employment
Alamo Area	\$11.3 b	144,573
Ark-Tex	\$0.9 b	11,994
Brazos Valley	\$1.1 b	13,849
Capital Area	\$8.4 b	108,408
Central Texas	\$1.9 b	25,096
Coastal Bend	\$2.4 b	30,111
Concho Valley	\$0.6 b	7,828
Deep East Texas	\$0.9 b	11,933
East Texas	\$3.5 b	46,315
Golden Crescent	\$0.5 b	7,225
Heart of Texas	\$1.6 b	20,880
Houston-Galveston Area	\$28.5 b	344,261
Lower Rio Grande Valley	\$5.1 b	68,768
Middle Rio Grande	\$0.4 b	5,217
Nortex	\$0.7 b	8,777
North Central Texas	\$31.1 b	377,963
Panhandle	\$1.3 b	16,932
Permian Basin	\$0.8 b	10,080
Rio Grande	\$3.0 b	37,627
South East Texas	\$1.3 b	17,395
South Plains	\$1.7 b	22,536
South Texas	\$0.9 b	12,509
Texoma	\$0.7 b	9,402
West Central Texas	\$1.4 b	17,933

Current Economic Benefits of Nonprofit Entities by Planning Region

(based on 2018 levels of activity)

Economic Region	Gross Product	Employment
Alamo Region	\$11.8 b	151,794
Capital Region	\$8.4 b	108,408
Central Texas Region	\$4.5 b	59,825
Gulf Coast Region	\$28.5 b	344,261
High Plains Region	\$3.0 b	39,322
Metroplex Region	\$31.8 b	387,364
Northwest Texas Region	\$2.0 b	26,713
South Texas Region	\$8.8 b	116,609
Southeast Texas Region	\$2.2 b	29,328
Upper East Texas Region	\$4.5 b	58,455
Upper Rio Grande Region	\$3.0 b	37,627
West Texas Region	\$1.4 b	17,906

Projected Economic Benefits

The economic stimulus associated with nonprofit entities is likely to grow over time. The Perryman Group estimates that by 2023, the overall economic benefits of Texas nonprofit entities will rise to **\$135.7 billion** in gross product and more than **1.6 million** jobs when multiplier effects are considered. In 2028, these benefits are projected to reach **\$163.8 billion** in gross product and over **1.8 million** jobs.

*The Perryman Group estimates that the economic benefits of Texas nonprofit entities will rise from the current level of **\$110 billion** in gross product each year and almost **1.4 million** jobs to **\$135.7 billion** in gross product and **1.6 million** jobs by 2023 and **\$163.8 billion** in gross product and **1.8 million** jobs in 2028 (including multiplier effects).*

Current and Projected Benefits of Texas Nonprofit Entities

	Total Expenditures	Gross Product	Personal Income	Permanent jobs
Current (2018)	\$216.6 b	\$110.0 b	\$74.7 b	1,377,612
2023	\$267.1 b	\$135.7 b	\$92.2 b	1,609,267
2028	\$322.3 b	\$163.8 b	\$111.3 b	1,849,729

Note: Includes multiplier effects. Dollar amounts in billions of 2018 dollars to eliminate the effects of inflation. See the Appendices for additional information regarding measures of business activity and methods used.

Source: The Perryman Group

For additional detail, see the Appendices to this report.

Philanthropic Organizations

The Perryman Group looked more specifically at spending by philanthropic organizations in order to illustrate their importance to the economy. Because relatively few employees can make decisions for hundreds of millions in grants, the effects of such organizations is particularly high on a per-employee basis.

The Perryman Group estimates that current economic benefits of spending by philanthropic organizations totals approximately \$7.4 billion in gross product each year and 100,724 jobs (including multiplier effects).

The Perryman Group estimates that current economic benefits of spending by philanthropic organizations totals approximately **\$7.4 billion** in gross product each year and **100,724** jobs (including multiplier effects). Note that because a large proportion of grant money goes to nonprofit entities, much of this impact is included in the economic benefits of nonprofit entities previously described.

Additional detail, including results by industry, is provided in the Appendices.

Conclusion

Nonprofit entities serve the needs of some of the state's most vulnerable populations, work to improve living conditions for all residents, provide education and health care, and enhance quality of life. As they fulfill these roles, nonprofit entities generate substantial economic activity across the state.

Texas nonprofit entities are crucial to the wellbeing of Texans, Texas families, businesses, communities, the economy, and the state as a whole.

The current economic benefits associated with nonprofit entities includes \$110 billion in gross product each year and nearly 1.4 million jobs (including multiplier effects). These benefits are expected to rise significantly over time.

Texas nonprofit entities are crucial to the wellbeing of Texans, Texas families, businesses, communities, the economy, and the state as a whole. They are a vital component of the economic and social fabric of the state.

Appendix A: Methods Used

US Multi-Regional Impact Assessment System

The basic modeling technique employed in this study is known as dynamic input-output analysis. This input-output segment of the methodology essentially uses extensive survey data, industry information, and a variety of corroborative source materials to create a matrix describing the various goods and services (known as resources or inputs) required to produce one unit (a dollar's worth) of output for a given sector. Once the base information is compiled, it can be mathematically simulated to generate evaluations of the magnitude of successive rounds of activity involved in the overall production process.

There are two essential steps in conducting an input-output analysis once the system is operational. The first major endeavor is to accurately define the levels of direct activity to be evaluated. In this case, input data regarding nonprofit operations in the state was obtained from a variety of sources including the Quarterly Census of Employment and Wages maintained by the Bureau of Labor Statistics, County Business Patterns from the Bureau of the Census, and the Regional Economic Information System of the Bureau of Economic Analysis. In particular, The Perryman Group made use of extensive primary data compiled by the Center for Nonprofits and Philanthropy of The Bush School of Government and Public Service at Texas A&M University. Input values were extended to 2018 and projected to 2023 and 2028 using projections from the US Multi-Regional Econometric Model (described below). These future values were fully adjusted for anticipated gains in productivity. The direct information on philanthropy by foundations in Texas was obtained by sector of giving from the most recent survey from Philanthropy Southwest, with the amounts being estimated for 2018 through the US Multi-Regional Econometric Model.

The second major phase of the analysis is the simulation of the input-output system to measure overall economic effects of the direct excess costs of the current situation. The present study was conducted within the context of the US Multi-Regional Impact Assessment System (USMRIAS) which was developed and is maintained by The Perryman Group. This model has been used in hundreds of diverse applications across the country and has an excellent reputation for accuracy and credibility; it has also been peer reviewed on multiple occasions. The systems used in the current simulations reflect the unique industrial structure of the Texas and various regional economies.

The USMRIAS is somewhat similar in format to the Input-Output Model of the United States which is maintained by the US Department of Commerce. The model developed by TPG, however, incorporates several important enhancements and refinements. Specifically, the expanded system includes (1) comprehensive 500-sector coverage for any county, multi-county, or urban region; (2) calculation of both total expenditures and value-added by industry and region; (3) direct estimation of expenditures for multiple basic input choices (expenditures, output, income, or employment); (4) extensive parameter localization; (5) price adjustments for real and nominal assessments by sectors and areas; (6) measurement of the induced impacts associated with payrolls and consumer spending; (7) embedded modules to estimate multi-sectoral direct spending effects; (8) estimation of retail spending activity by consumers; and (9) comprehensive linkage and integration capabilities with a wide variety of econometric, real estate, occupational, and fiscal impact models.

The impact assessment (input-output) process essentially estimates the amounts of all types of goods and services required to produce one unit (a dollar's worth) of a specific type of output. For purposes of illustrating the nature of the system, it is useful to think of inputs and outputs in dollar (rather than physical) terms. As an example, the construction of a new building will require specific dollar amounts of lumber, glass, concrete, hand tools, architectural services, interior design services, paint, plumbing, and numerous other elements. Each of these suppliers must, in turn, purchase additional dollar amounts of inputs. This process continues through multiple rounds of production, thus generating subsequent increments to business activity. The initial process of building the facility is known as the *direct effect*. The ensuing transactions in the output chain constitute the *indirect effect*.

Another pattern that arises in response to any direct economic activity comes from the payroll dollars received by employees at each stage of the production cycle. As workers are compensated, they use some of their income for taxes, savings, and purchases from external markets. A substantial portion, however, is spent locally on food, clothing, health care services, utilities, housing, recreation, and other items. Typical purchasing patterns in the relevant areas are obtained from the Center for Community and Economic Research *Cost of Living Index*, a privately compiled inter-regional measure which has been widely used for several decades, and the *Consumer Expenditure Survey* of the US Department of Labor. These initial outlays by area residents generate further secondary activity as local providers acquire inputs to meet this consumer demand. These consumer spending impacts are known as the *induced effect*. The USMRIAS is designed to provide realistic, yet conservative, estimates of these phenomena.

Sources for information used in this process include the Bureau of the Census, the Bureau of Labor Statistics, the Regional Economic Information System of the US Department of Commerce, and other public and private sources. The pricing data are compiled from the US Department of Labor and the US Department of Commerce. The verification and testing procedures make use of extensive public and private sources.

Impacts were measured in constant 2018 dollars to eliminate the effects of inflation.

The USMRIAS generates estimates of the effect on several measures of business activity. The most comprehensive measure of economic activity used in this study is **Total Expenditures**. This measure incorporates every dollar that changes hands in any transaction. For example, suppose a farmer sells wheat to a miller for \$0.50; the miller then sells flour to a baker for \$0.75; the baker, in turn, sells bread to a customer for \$1.25. The Total Expenditures recorded in this instance would be \$2.50, that is, $\$0.50 + \$0.75 + \$1.25$. This measure is quite broad but is useful in that (1) it reflects the overall interplay of all industries in the economy, and (2) some key fiscal variables such as sales taxes are linked to aggregate spending.

A second measure of business activity frequently employed in this analysis is that of **Gross Product**. This indicator represents the regional equivalent of Gross Domestic Product, the most commonly reported statistic regarding national economic performance. In other words, the Gross Product of Texas is the amount of US output that is produced in that state; it is defined as the value of all final goods produced in a given region for a specific period of time. Stated differently, it captures the amount of value-added (gross area product) over intermediate goods and services at each stage of the production process, that is, it eliminates the double counting in the Total Expenditures concept. Using the example above, the Gross Product is \$1.25 (the value of the bread) rather than \$2.50.

Alternatively, it may be viewed as the sum of the value-added by the farmer, \$0.50; the miller, \$0.25 ($\$0.75 - \0.50); and the baker, \$0.50 ($\$1.25 - \0.75). The total value-added is, therefore, \$1.25, which is equivalent to the final value of the bread. In many industries, the primary component of value-added is the wage and salary payments to employees.

The third gauge of economic activity used in this evaluation is **Personal Income**. As the name implies, Personal Income is simply the income received by individuals, whether in the form of wages, salaries, interest, dividends, proprietors' profits, or other sources. It may thus be viewed as the segment of overall impacts which flows directly to the citizenry.

The fourth measure, **Retail Sales**, represents the component of Total Expenditures which occurs in retail outlets (general merchandise stores, automobile dealers and service stations, building materials stores, food stores, drugstores, restaurants, and so forth). Retail Sales is a commonly used measure of consumer activity.

The final aggregates used are **Permanent Jobs and Person-Years of Employment**, reflect the full-time equivalent jobs generated by an activity. For an economic stimulus expected to endure (such as the ongoing operations of a facility), the Permanent Jobs Measure is used. It should be noted that, unlike the dollar values described above, Permanent Jobs is a “stock” rather than a “flow.” In other words, if an area produces \$1 million in output in 2016 and \$1 million in 2017, it is appropriate to say that \$2 million was achieved in the 2016-17 period. If the same area has 100 people working in 2016 and 100 in 2017, it only has 100 Permanent Jobs. When a flow of jobs is measured, such as in a construction project or a cumulative assessment over multiple years, it is appropriate to measure employment in Person-Years (a person working for a year). This concept is distinct from Permanent Jobs, which anticipates that the relevant positions will be maintained on a continuing basis.

US Multi-Regional Econometric Model

Overview

The US Multi-Regional Econometric Model (also known as the Texas Econometric Model) was developed by Dr. M. Ray Perryman, President and CEO of The Perryman Group (TPG), beginning 40 years ago as a Texas model and has been consistently maintained, expanded, and updated to a national level since that time. It is formulated in an internally consistent manner and is designed to permit the integration of relevant global, national, state, and local factors into the projection process. It is the result of more than three decades of continuing research in econometrics, economic theory, statistical methods, and key policy issues and behavioral patterns, as well as intensive, ongoing study of all aspects of the global, US, state, and metropolitan area economies. It is extensively used by scores of federal and State governmental entities on an ongoing basis, as well as hundreds of major corporations. It is employed in the current analysis to generate estimates of the industrial composition necessary to allocate various benefits as well as in projecting future direct benefits.

This section describes the forecasting process in a comprehensive manner, focusing on both the modeling and the supplemental analysis. The overall methodology, while certainly not ensuring perfect foresight, permits an enormous body of relevant information to impact the economic outlook in a systematic manner.

Model Logic and Structure

The US Multi-Regional Econometric Model revolves around a core system which projects output (real and nominal), income (real and nominal), and employment by industry in a simultaneous manner. For purposes of illustration, it is useful to initially consider the employment functions. Essentially, employment within the system is a derived demand relationship obtained from a neo-Classical production function. The expressions are augmented to include dynamic temporal adjustments to changes in relative factor input costs, output and (implicitly) productivity, and technological progress over time. Thus, the typical equation includes output, the relative real cost of labor and capital, dynamic lag structures, and a technological adjustment parameter. The functional form is logarithmic, thus preserving the theoretical consistency with the neo-Classical formulation.

The income segment of the model is divided into wage and non-wage components. The wage equations, like their employment counterparts, are individually estimated at the 3-digit North American Industry Classification

System (NAICS) level of aggregation. Hence, income by place of work is measured for approximately 90 production categories. The wage equations measure real compensation, with the form of the variable structure differing between “basic” and “non-basic.”

The basic industries, comprised primarily of the various components of Mining, Agriculture, and Manufacturing, are export-oriented, i.e., they bring external dollars into the area and form the core of the economy. The production of these sectors typically flows into national and international markets; hence, the labor markets are influenced by conditions in areas beyond the borders of the particular region. Thus, real (inflation-adjusted) wages in the basic industry are expressed as a function of the corresponding national rates, as well as measures of local labor market conditions (the reciprocal of the unemployment rate), dynamic adjustment parameters, and ongoing trends.

The “non-basic” sectors are somewhat different in nature, as the strength of their labor markets is linked to the health of the local export sectors. Consequently, wages in these industries are related to those in the basic segment of the economy. The relationship also includes the local labor market measures contained in the basic wage equations.

Note that compensation rates in the export or “basic” sectors provide a key element of the interaction of the regional economies with national and international market phenomena, while the “non-basic” or local industries are strongly impacted by area production levels. Given the wage and employment equations, multiplicative identities in each industry provide expressions for total compensation; these totals may then be aggregated to determine aggregate wage and salary income. Simple linkage equations are then estimated for the calculation of personal income by place of work.

The non-labor aspects of personal income are modeled at the regional level using straightforward empirical expressions relating to national performance, dynamic responses, and evolving temporal patterns. In some instances (such as dividends, rents, and others) national variables (for example, interest rates) directly enter the forecasting system. These factors have numerous other implicit linkages into the system resulting from their simultaneous interaction with other phenomena in national and international markets which are explicitly included in various expressions.

The output or gross area product expressions are also developed at the 3-digit NAICS level. Regional output for basic industries is linked to national performance in the relevant industries, local and national production in key related sectors,

relative area and national labor costs in the industry, dynamic adjustment parameters, and ongoing changes in industrial interrelationships (driven by technological changes in production processes).

Output in the non-basic sectors is modeled as a function of basic production levels, output in related local support industries (if applicable), dynamic temporal adjustments, and ongoing patterns. The inter-industry linkages are obtained from the input-output (impact assessment) system which is part of the overall integrated modeling structure maintained by The Perryman Group. Note that the dominant component of the econometric system involves the simultaneous estimation and projection of output (real and nominal), income (real and nominal), and employment at a disaggregated industrial level. This process, of necessity, also produces projections of regional price deflators by industry. These values are affected by both national pricing patterns and local cost variations and permit changes in prices to impact other aspects of economic behavior. Income is converted from real to nominal terms using the appropriate Consumer Price Index.

Several other components of the model are critical to the forecasting process. The demographic module includes (1) a linkage equation between wage and salary (establishment) employment and household employment, (2) a labor force participation rate function, and (3) a complete population system with endogenous migration. Given household employment, labor force participation (which is a function of economic conditions and evolving patterns of worker preferences), and the working age population, the unemployment rate and level become identities.

The population system uses Census information, fertility rates, and life tables to determine the “natural” changes in population by age group. Migration, the most difficult segment of population dynamics to track, is estimated in relation to relative regional and extra-regional economic conditions over time. Because evolving economic conditions determine migration in the system, population changes are allowed to interact simultaneously with overall economic conditions. Through this process, migration is treated as endogenous to the system, thus allowing population to vary in accordance with relative business performance (particularly employment).

Real retail sales is related to income, interest rates, dynamic adjustments, and patterns in consumer behavior on a store group basis. It is expressed on an inflation-adjusted basis. Inflation at the state level relates to national patterns, indicators of relative economic conditions, and ongoing trends. As noted earlier, prices are endogenous to the system.

A final significant segment of the forecasting system relates to real estate absorption and activity. The short-term demand for various types of property is determined by underlying economic and demographic factors, with short-term adjustments to reflect the current status of the pertinent building cycle. In some instances, this portion of the forecast requires integration with the Multi-Regional Industry-Occupation System which is maintained by The Perryman Group. This system also allows any employment simulation or forecast from the econometric model to be translated into a highly detailed occupational profile.

The overall US Multi-Regional Econometric Model contains numerous additional specifications, and individual expressions are modified to reflect alternative lag structures, empirical properties of the estimates, simulation requirements, and similar phenomena. Moreover, it is updated on an ongoing basis as new data releases become available. Nonetheless, the above synopsis offers a basic understanding of the overall structure and underlying logic of the system.

Model Simulation and Multi-Regional Structure

The initial phase of the simulation process is the execution of a standard non-linear algorithm for the state-level system and that of each of the individual sub-areas, if any, being examined. The external assumptions are derived from scenarios developed through national and international models and extensive analysis by The Perryman Group.

Once the initial simulations are completed, they are merged into a single system with additive constraints and interregional flows. Using information on minimum regional requirements, import needs, export potential, and locations, it becomes possible to balance the various forecasts into a mathematically consistent set of results.

The iterative simulation process has the additional property of imposing a global convergence criterion across the entire multi-regional system, with balance being achieved simultaneously on both a sectoral and a geographic basis. This approach is particularly critical on non-linear dynamic systems, as independent simulations of individual systems often yield unstable, non-convergent outcomes.

It should be noted that the underlying data for the modeling and simulation process are frequently updated and revised by the various public and private entities compiling them. Whenever those modifications to the database occur, they bring corresponding changes to the structural parameter estimates of the various systems and the solutions to the simulation and forecasting system. The multi-regional version of the US Multi-Regional Econometric Model is re-

estimated and simulated with each such data release, thus providing a constantly evolving and current assessment of state and local business activity.

The Final Forecast

The process described above is followed to produce an initial set of projections. Through the comprehensive multi-regional modeling and simulation process, a systematic analysis is generated which accounts for both historical patterns in economic performance and inter-relationships and best available information on the future course of pertinent external factors. While the best available techniques and data are employed in this effort, they are not capable of directly capturing “street sense,” i.e., the contemporaneous and often non-quantifiable information that can materially affect economic outcomes. In order to provide a comprehensive approach to the prediction of business conditions and to achieve the property of statistical consistence, it is necessary to compile and assimilate extensive material regarding current events and factors affecting the forecast.

This critical aspect of the forecasting methodology includes activities such as (1) daily review of hundreds of financial and business publications and electronic information sites; (2) review of major newspapers and online news sources on a daily basis; (3) direct discussions with key business and political leaders; (4) face-to-face discussions with representatives of major industry groups; and (5) frequent site visits to various regions. The insights arising from this “fact finding” are analyzed and evaluated for their effects on the likely course of the future activity.

Another vital information resource stems from the firm’s ongoing interaction with key players in the international, domestic, and state economic scenes. Such activities include visiting with corporate groups on a regular basis and being regularly involved in the policy process at all levels. The firm is also an active participant in many major corporate relocations, economic development initiatives, and regulatory proceedings.

Once organized, this information is carefully assessed and, when appropriate, independently verified. The impact on specific communities and sectors that is distinct from what is captured by the econometric system is then factored into the forecast analysis. For example, the opening or closing of a major facility, particularly in a relatively small area, can cause a sudden change in business performance that will not be accounted for by either a modeling system based on historical relationships or expected (primarily national and international) factors.

The final step in the forecasting process is the integration of this material into the results in a logical and mathematically consistent manner. In some instances, this task is accomplished through “constant adjustment factors” which augment relevant equations. In other cases, anticipated changes in industrial structure or regulatory parameters are initially simulated within the context of the Multi-Regional Impact Assessment System to estimate their ultimate effects by sector. Those findings are then factored into the simulation as constant adjustments on a distributed temporal basis. Once this scenario is formulated, the extended system is again balanced across regions and sectors through an iterative simulation algorithm analogous to that described in the preceding section.
